

Global subsea compression technology strategy

We conducted a review of a major operating company's global gas portfolio to assist them in understanding the specific challenges in relation to gas compression and subsea power supply.

The work included engaging with asset managers, technical personnel and thought leaders across the IOC's operational and R&D divisions. Workshops were held to analyse the information from interviews, and this was used to define the IOC's 5-10 year technology development plan and commercialisation strategy for subsea gas compression technology.
